Sorting

2. Click the sequence of integers that represent the content of the array A=[42, 8, 26, 35, 23, 32, 12, 39] with n integers after 5 passes of this version of **Insertion** Sort.

```
for (i = 1; i <= 5; i++) { // 5 passes
  e = A[i]; j = i;
  while (j > 0) {
    if (A[j-1] > e)
      A[j] = A[j-1];
    else
      break;
    j--;
  }
  A[j] = e;
}
```

Your answer is: 8 , 23 , 26 , 32 , 35 , 42 , 12 , 39

You answered this question correctly! :) (Report Bug with Question)

Start A New Session

First n+1 numbers will be sorted. Insertion sort is **STABLE**, so the rest of the elements is unaffected.

3. An array of 10 integers is being sorted in ascending order using **Quicksort**.
Suppose the algorithm has just finished the first pass of partitioning and pivot swapping thus changing the content of the original array into the following array:
[101, 104, 106, 109, 103, 106, 108, 115, 113, 107]
From the resulting array above, determine how many integers could have been the pivot?
Note: elements == pivot are partitioned to the right.

1

You answered this question correctly! :) (Report Bug with Question)

Start A New Session

Find number such that every number to the left is lesser than (or equal to) itself and every number to the right is greater than (or equal to) itself

4. How many **swap(s)** is/are required to sort an array of n=6 integers: [16, 28, 9, 13, 26, 15] using this version of **Bubble** Sort?

```
for (j = 0; j < n-1; j++)
  for (i = 0; i < n-j-1; i++)
    if (A[i] > A[i+1])
      swap(A[i], A[i+1]);
```

8

You answered this question correctly! :) (Report Bug with Question)

Start A New Session

Brute force count swaps

5. Click the sequence of integers that represent the content of the array A=[6, 38, 18, 22, 20, 19, 29, 34] with n integers after 4 passes of this version of **Selection** Sort.

```
for (i = 0; i < 4; i++) { // 4 passes
  cur_min = i;
  for (j = i+1; j < n; j++)
    if (A[j] < A[cur_min])
      cur_min = j;
  swap(A[i], A[cur_min]);
}
```

Your answer is: 6 , 18 , 19 , 20 , 38 , 22 , 29 , 34

You answered this question wrongly.

The correct answer is: 6 , 18 , 19 , 20 , 22 , 38 , 29 , 34

Start A New Session

Selection sort is **UNSTABLE**. Keep track of where elements are swapped to.

11. Click the sequence of integers that represent the content of the array A=[38, 4, 6, 5, 29, 34, 32, 26] with n integers after 7 passes of this version of **Bubble** Sort.

```
for (j = 0; j < 7; j++) // 7 passes
  for (i = 0; i < n-j-1; i++)
    if (A[i] > A[i+1])
      swap(A[i], A[i+1]);
```

Your answer is: 4 , 5 , 6 , 26 , 29 , 32 , 34 , 38

You answered this question correctly! :) (Report Bug with Question)

Start A New Session

Biggest 7 elements are bubbled right. So, this sequence of 8 integers will be fully sorted lol

12. How many **comparison(s)** is/are required to sort an array of n=5 integers: [15, 17, 14, 16, 13] using this version of **Insertion** Sort?

Start A New Session

```
for (i = 1; i < n; i++) {
  e = A[i]; j = i;
  while (j > 0) {
    if (A[j-1] > e) // each execution of this if-statement is counted as one comparison
      A[j] = A[j-1];
    else
      break;
    j--;
  }
  A[j] = e;
}
```

9

You answered this question correctly! :) (Report Bug with Question)

Become the algorithm

14. How many **pass(es)** is/are required to sort an array of n=5 integers: [35, 26, 37, 9, 7] using this version of **Bubble** Sort?

Start A New Session

```
j = 0;
do {
  swapped = false; j++;
  for (i = 0; i < n-j; i++) // each completion of this for-loop is counted as one pass
    if (A[i] > A[i+1]) { // each execution of this if-statement is counted as one comparison
      swap(A[i], A[i+1]);
      swapped = true;
    }
} while (swapped);
```

4

You answered this question wrongly.

The correct answer is: **5**

Become the algorithm. This is the "smart" version which breaks if no new swaps are made in the pass-through.

Linked list

2. In the pseudocode program below, `list` is an initially empty Singly Linked List.
The function `populateList()` adds the integers **[8, 7, 9, 8, 3, 5]** to the tail of `list` sequentially.
What is the output of the program?
Select 'No Answer' if the program results in an error.

Start A New Session

```
populateList();
int sum = 0;
Node n = list.head; // list.head/list.tail points to the first/last integer in list
n = list.head;
n = list.head;
n = n.next;
n = n.next;
sum += n.next.value;
n = n.next;
n = list.head;
sum += n.next.value;
print sum;
```

☐ No answer

16

You answered this question wrongly.

The correct answer is: **15** (Report Bug with Question)

Just be careful. Tail pointer is usually not updated. Final_element.next will lead to NULL (still valid), but attempting to NULL.next or dereference NULL will lead to compilation error -> NO ANSWER

Matthew's VA Cheat Sheet

4. The Singly Linked List below represents a stack st where st.peek() = 64. Suppose the following operations are performed:
st.pop();
st.push(34);
st.pop();
What is the output of st.peek()? Select 'No Answer' if the program results in an error.

Refer to chart

6. What is the **MAXimum** number of **swaps** between heap elements required to construct a max heap of 10 elements using the **O(n)** BuildHeap(array)?

Start A New Session

8

You answered this question correctly! :) (Report Bug with Question)

Refer to chart

3. An integer 98 is going to be inserted into the binary **MAX** heap as shown in the picture, click the sequence of vertices that will swap their content with vertex 98 during this insertion.

Start A New Session

No answer

Your answer is: **62 , 74 , 89 , 91**

You answered this question correctly! :) (Report Bug with Question)

Add to bottom-most and left-most available spot. Bubble it up.

5. We perform O(n) Build Heap to the complete binary tree as shown in the picture, click subset of vertices (from parent(heapsize) down to 1) that violates the property of a **MAX** heap and will be shifted down.

Start A New Session

No answer

Your answer is: **24 , 22 , 17 , 33 , 10 , 75 , 90 , 71**

You answered this question correctly! :) (Report Bug with Question)
Vertices that are smaller than any of their descendants will be shifted down.

14. We perform 13 extract operations to the binary **MAX** heap as shown in the picture, click the subset of vertices that will remain in the binary **MAX** heap after all these operations are executed.

Start A New Session

Your answer is: **22 , 28 , 18 , 17**

You answered this question correctly! :) (Report Bug with Question)

Smallest 17 – 13 = 4 elements are remaining

Matthew's VA Cheat Sheet

1. Click the <u>subset</u> of vertices that are greater than 91 in this **MIN** heap.

☐ No answer

Your answer is: **96 , 93**

You answered this question correctly! :) (Report Bug with Question)

Start A New Session
Find all vertex bigger than the query number

Binary Search Tree

BST: Left child < current < Right child.
Successor: Most direct way to the next element bigger than the node of interest
Predecessor: Most direct way to the next element smaller than the node of interest
**Pre**order: **Print first**, then check children
Inorder: Check left, **then print**, then check right
Postorder: Check children first, **then print.**

3. What is the <u>height</u> of this BST?

| 5 |

You answered this question correctly! :) (Report Bug with Question)

Start A New Session

Largest number of edges from root to leaf

4. Suppose that we have all distinct integers inside a BST of unknown structure and we want to search for the integer 4917. True or False: It is possible to have a search <u>sequence</u> as follows: **4907, 5405, 5175, 4984, 4924, 4909, 4912, 4919, 4917**.

🔴 True
⚪ False

You answered this question correctly! :) (Report Bug with Question)

Start A New Session

If target is bigger, next number should be bigger; if target smaller, next number should be smaller.

8. How many structurally different BSTs can you form with **8 distinct** elements?

| 1430 |

You answered this question correctly! :) (Report Bug with Question)

Start A New Session

$$\frac{(2n)!}{(n+1)!\,n!}$$

10. What is the value of the element with <u>rank</u> **11** in this BST?
Start A New Session

Your answer is: **80**

You answered this question wrongly.

The correct answer is: **73**
Be careful: Rank is 1-based in VisuAlgo.
(Report Bug with Question)

indexed-1. Leftmost is 1. Flatten the tree and count until rank.
AVL Tree

1. Will the deletion of **78** in the following AVL tree result in any rotations?

Start A New Session

○ Yes
○ No

You answered this question correctly! :) **(Report Bug with Question)**

Search upwards starting from the replaced node <u>all the way to root</u> and see if anyone complains
3. An integer **17** is going to be inserted into the AVL tree below. Will the insertion result in any rotations?

Start A New Session

○ Yes
○ No

You answered this question correctly! :) **(Report Bug with Question)**

Insert into correct position and check for rotations. Max 1 "fix" required for insertion.

9. What is the **minimum** number of vertices in an AVL tree of **height** **11**?

[Start A New Session]

375

You answered this question wrongly.

The correct answer is: **376**

Height(n) = height(n-1) + height(n-2) + 1

Height	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Vertices	1	2	4	7	12	20	33	54	88	143	232	376	609	986	1596	2583

10. Given the AVL as shown in the picture, **delete** at least **3** vertex/vertices and at most **4** vertex/vertices one after another such that a total of **1** rotation(s) occur(s). Note that Left-Right or Right-Left successive rotations are counted as 1 rotation.

[Start A New Session]

☐ No answer

Your answer is: **63 , 49 , 25 , 33**

You answered this question correctly! :) **(Report Bug with Question)**
Delete and check for rotation.

Graph DS

Directed acyclic, just make sure small number -> bigger number.
Tree: V vertices, V-1 edges, acyclic.
Complete graph: An edge between any pair of vertices.
Connected graph: From any vertex, can get to all other vertex

2. Which best graph DS(es) should you use to store a simple undirected graph with 10000 vertices, 10000 edges, and the neighbours are frequently enumerated?
Suppose your computer only has enough memory to store 40000 entries.

[Start A New Session]

☐ Adjacency Matrix
☑ Adjacency List
☐ Edge List

You answered this question correctly! :) **(Report Bug with Question)**

Need to enumerate neighbours, **BUT NOT ENOUGH MEMORY (we need V^2 entries for AM)**

3. Which best graph DS(es) should you use to store a simple undirected graph with 200 vertices, 19900 edges, and the neighbours are frequently enumerated?
Suppose your computer only has enough memory to store 40000 entries.

[Start A New Session]

☑ Adjacency Matrix
☑ Adjacency List
☐ Edge List

You answered this question correctly! :) **(Report Bug with Question)**

Adjacency Matrix enumerate not as fast but still accepted, **so it depends on memory.**

7. Which best graph DS(es) should you use to store a simple undirected graph with 200 vertices, 19900 edges, and the existence of **edge(u, v)** is frequently asked?
Suppose your computer only has enough memory to store 40000 entries.

- [x] Adjacency Matrix
- [ ] Adjacency List
- [ ] Edge List

You answered this question correctly! :) **(Report Bug with Question)**

Start A New Session

Ask about existence of edge -> AM (Good for Floyd-Warshall's 4 line wonder :D)

11. Which best graph DS(es) should you use to store a simple undirected graph with 200 vertices, 19900 edges, and the edges need to be sorted?
Suppose your computer only has enough memory to store 40000 entries.

- [ ] Adjacency Matrix
- [ ] Adjacency List
- [x] Edge List

You answered this question correctly! :) **(Report Bug with Question)**

Start A New Session

Edges in an edge list can be easily sorted by weight
Graph traversal

3. In the following Directed Acyclic Graph, how many simple paths are there from vertex **0** to **9**?

6

You answered this question wrongly.

The correct answer is: 8 **(Report Bug with Question)**

Start A New Session

Write down all the paths

Matthew's VA Cheat Sheet

5. Click all the edges that make up the spanning tree induced by **DFS** starting from source vertex **6** for this graph.
The neighbours of a vertex are listed in ascending vertex number.
Please select the edges in the order that they are processed.

Start A New Session

No answer

Your answer is: **(6 , 3) , (3 , 1) , (2 , 1) , (2 , 0) , (0 , 4) , (7 , 0) , (9 , 2) , (9 , 8) , (5 , 6)**

You answered this question correctly! :) (Report Bug with Question)
DFS: Go deep, recurse back and go deep for neighbour. Take note of order of neighbours.

8. Click the <u>sequence</u> of vertices that are visited by **BFS** from source vertex **6** (inclusive).
The neighbours of a vertex are listed in ascending vertex number.

Start A New Session

Your answer is: **6 , 0 , 3 , 7 , 9 , 2 , 8 , 5 , 1 , 4**

You answered this question correctly! :) (Report Bug with Question)
BFS: Visit all neighbours, then all neighbours of neighbours, and so on. Keep track of the order of exploration of neighbours

Matthew's VA Cheat Sheet

9. Click the <u>sequence</u> of vertices that result in a valid topological sort of the graph.
If the graph has no valid topological sort, select 'No Answer'.

☐ No answer

Your answer is: **0 , 1 , 2 , 5 , 4 , 3 , 8 , 9 , 6 , 7**

You answered this question correctly! :) (Report Bug with Question)

Topological sort

10. Click all the edges that must belong to every spanning tree of the graph shown below.

☐ No answer

Your answer is: **(9 , 5) , (2 , 4)**

You answered this question correctly! :) (Report Bug with Question)

Vertex with only 1 edge

11. How many different spanning trees are there in a complete graph with **8** vertices?

262144

You answered this question correctly! :) (Report Bug with Question)

$$n^{n-2}$$

13. Consider the following partial pseudocode for DFS:

```
DFS(u)
  visited[u] = true;
  for all v adjacent to u
    if (!visited[v]) { DFS(v); }
  print(u);
```

Suppose this code is run on the following BST starting from the root, click the sequence of vertices in the order that they are printed. Assume that the left child is always visited before the right child.

Your answer is: **1 , 21 , 27 , 68 , 74 , 67 , 18**

You answered this question correctly! :) **(Report Bug with Question)**
Print comes after exploring all neighbours -> Post-order traversal

SSSP

1. Draw a simple connected weighted directed graph with **3** vertices and **5** directed edges such that running **Modified Dijkstra's algorithm** from source vertex 0 makes the algorithm run indefinitely. The weights of the edges have to be distinct.

You answered this question correctly! :) **(Report Bug with Question)**
Create a negative cycle. **MAKE SURE THE WEIGHTS ARE DISTINCT**

7. Click the sequence of vertices such that when all the outgoing edges of these vertices are relaxed in this order using One-Pass Bellman-Ford's algorithm, the SSSP problem can be solved in O(V+E) time.

Your answer is: **6 , 7 , 1 , 2 , 3 , 5 , 4 , 0 , 8**

You answered this question correctly! :) **(Report Bug with Question)**

Topological sort
Dijkstra Killer. **THERE ARE (E-V+1) TRIANGLES.**

Bellman-Ford Killer. 0 -> (N-1) -> (N-2) -> ... -> 2 -> 1

SSSP- Path Weight Criteria

	Bellman-Ford	Original Dijkstra	Modified Dijkstra
Terminate	Always	Always	Does not terminate when there's negative weight cycle
Wrong when there's	Negative eight cycle	Negative edges and Negative weight cycle	Negative weight cycle- it doesn't even terminate in the first place ☹

Note:

If the graph contains negative edges but does not contain any negative cycles, Bellman Ford and modified Dijkstra will give the correct answer all the time.

Original Dijkstra *could* still give the correct answer (run Bellman Ford and original Dijkstra and compare the answers)

Matthew's VA Cheat Sheet
